**Date:** November 30, 2011

Looking to support the latest versions of Microsoft Exchange Server, Microsoft Office SharePoint Server and a wide array of solutions from data backup technology providers, Kroll Ontrack has announced enhancements to Ontrack PowerControls version 6.1.

Eliminating the need for a duplicate recovery server, Ontrack PowerControls ExtractWizard is a powerful tool that allows users to restore data from disk and tape backups to an alternative location. Current support is included for Netbackup, IBM Tivoli Storage Manager, CA ARCserve, EMC Networker, HP OpenView Storage Data Protector, CommVault Galaxy, Ultrabac, Symantec BackupExec and Microsoft NT Backup, the company stated in a press release.

"According to a June 2011 survey of existing Ontrack PowerControls customers, over a quarter of respondents routinely use the Ontrack PowerControls tool to save over 50 percent of time managing their environments," said Jim Reinert, vice president of product development, Kroll Ontrack. "The time and costs saved through utilizing this solution is significant to users. As such, Kroll Ontrack is committed to keeping the Ontrack PowerControls tool in line with industry demands, adjusting its offerings to support product updates."

Used by applications to back-up hosted Exchange and other Microsoft systems, VSS is a Microsoft technology that allows access to a "point in time" snapshot of a logical drive, and is now mandatory in Microsoft Exchange 2010. Users can search and recover granular items from their most recent backup snapshots from Microsoft Exchange 2007 and 2010 as the company supports this new technology.
